

MULAMO CONCENTRATO

Emulsifiable form oil

Features

MULAMO CONCENTRATO is a concentrated disarming product, based on synthetic oils and special emulsifiers, to be diluted with water before use, ideal for disarming planed and rough wooden and metal forms.

Thanks to its particular formulation, MULAMO CONCENTRATO ensures a good protection of the forms.

Instructions for use

MULAMO CONCENTRATO is diluted with water and results in a white emulsion, stable in time.

During its preparation:

- don't use hard water (with high mineral content);
- pour oil into water and shake well;

Dilution ratios:

- in case of wooden forms: dilute 1 kg of MULAMO CONCENTRATO with maximum 10 kg of water;
- in case of metal forms: dilute 1 kg of MULAMO CONCENTRATO with maximum 6 kg of water.

We underline that the dilution ratio has to be often optimized by testing it in function of the jobsite conditions and the disarming requirements of the castings and their finishings.

The application can be done by brush or by spray, this latter to be preferred since it guarantees:

- an homogeneous layer of disarming product;
- a faster water evaporation;
- a shorter application time.

Apply at least 2 hours before the casting.

WARNING

Mix up again the emulsion before application. Spread the diluted disarming product always some hours before the concrete set up. When the surface is not yet dried, protect it from rain. Protect forms treated with the emulsified disarming product from frost until the layer is not completely dried. MULAMO CONCENTRATO diluted with water has to be protected from frost.

Storage

If closed in the original packaging, it can be stored for at least 12 months.

Consumption

With 1 kg of MULAMO CONCENTRATO you can treat from 50 to 100 m² of form depending on the dilution degree and the form type.

Packagings

5 kg, 10 kg and 23 kg canisters.

185 kg drums
